AB The invention concerns endoprosthesis supporting structures that are composed of magnesium alloys that contain:  
 magnesium > 90%; yttrium 3.7-5.5%; rare earth metals (preferably neodymium) 1.5-4.4%; remaining part (zirconium or lithium) < 1%.  
 Stents, especially coronary stents are produced; wire is prepared from the alloy; the wire is bended in a zig-zag-structured tube that is expandable. The stents can be coated with drugs.
